Getting Started with Jev

Jev judges. Your code decides. An LLM writes the replies.

Module 1 · Meet Jev: Typed Decisions Instead of Text

The reply that breaks your parser

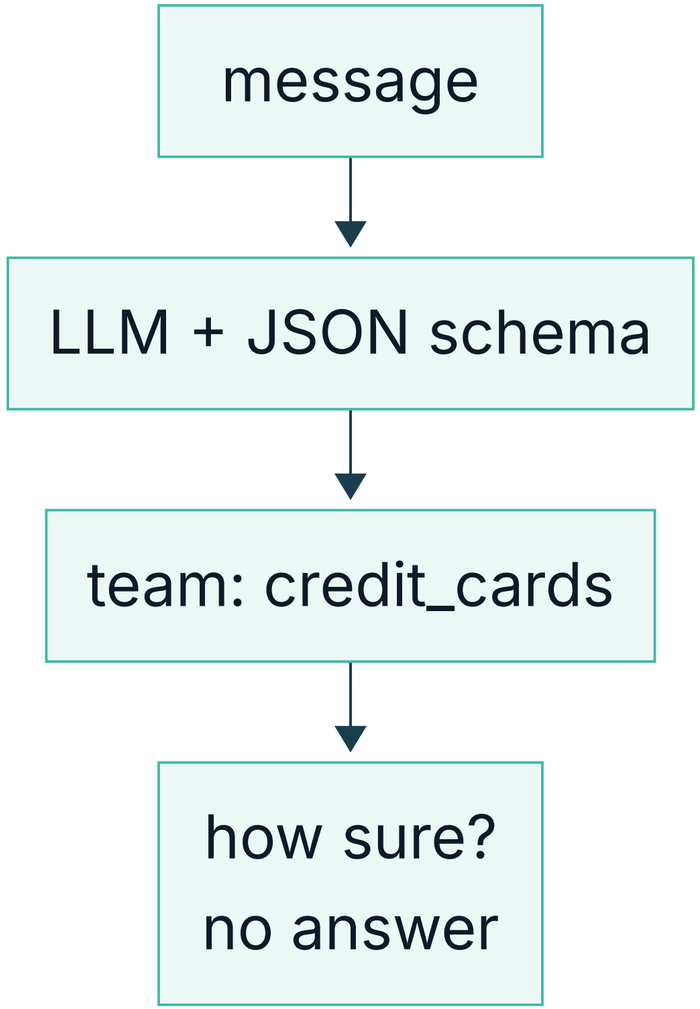

Prompt with no format line: 13 to 18 of 40 replies came back as markdown or a sentence

Source: measured in this course on 2026-10-30 (gpt-5.4-mini-2026-03-17, 40 CLINC150 messages, three runs) · CLINC150 on Hugging Face

A schema fixes the format, not the doubt

- An enum in the schema: always a valid team
- No probability: was it 51% or 99%?
- No probability means no threshold you can set

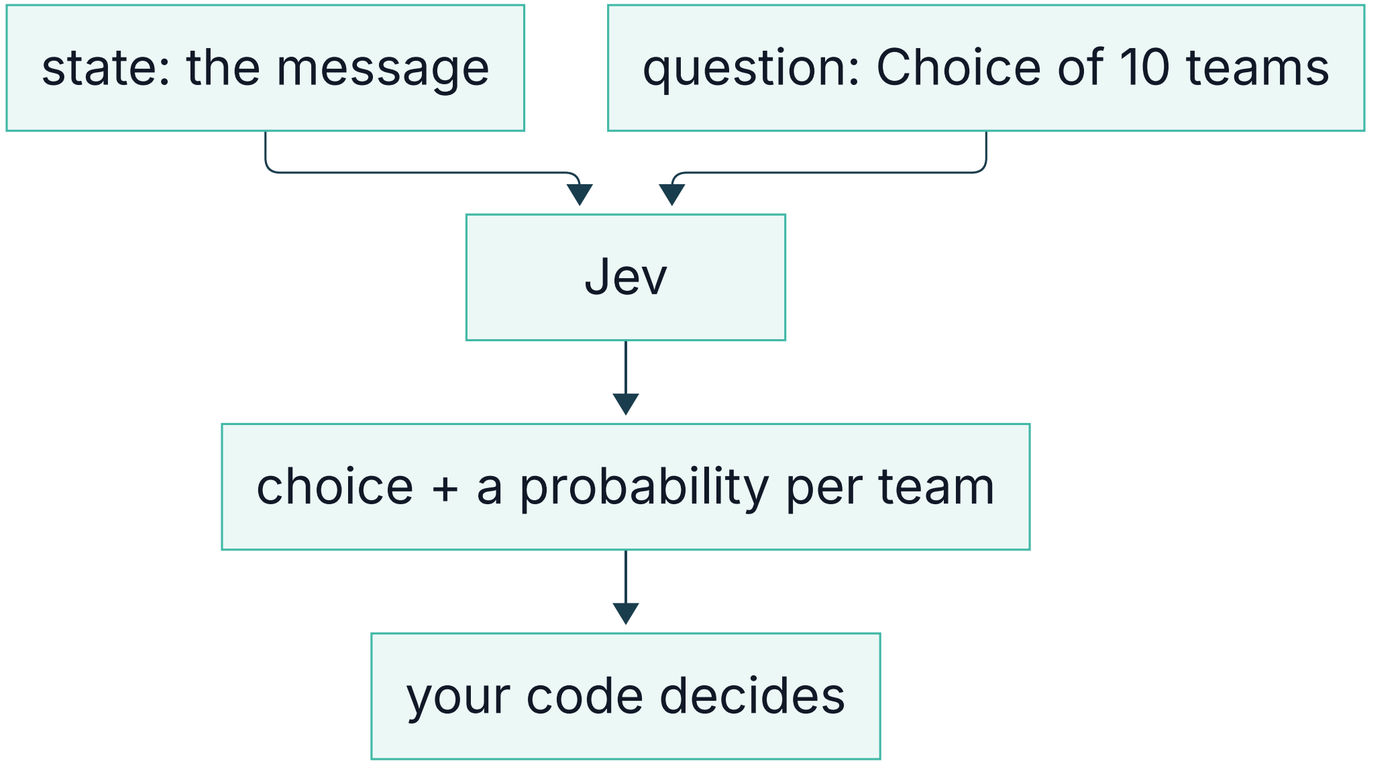

Source: OpenAI: Structured outputs

Switch to the notebook: Demo 1

Jev answers questions. It never writes text.

- Send a message and a question; get a probability for every option
- A System One model: fast typed judgments, no text
- Predict: on 40 messages, who is more accurate, faster, cheaper?

Source: TypeSafe docs: Introduction · TypeSafe docs: System One

Accuracy within noise, 4x faster, 12x cheaper

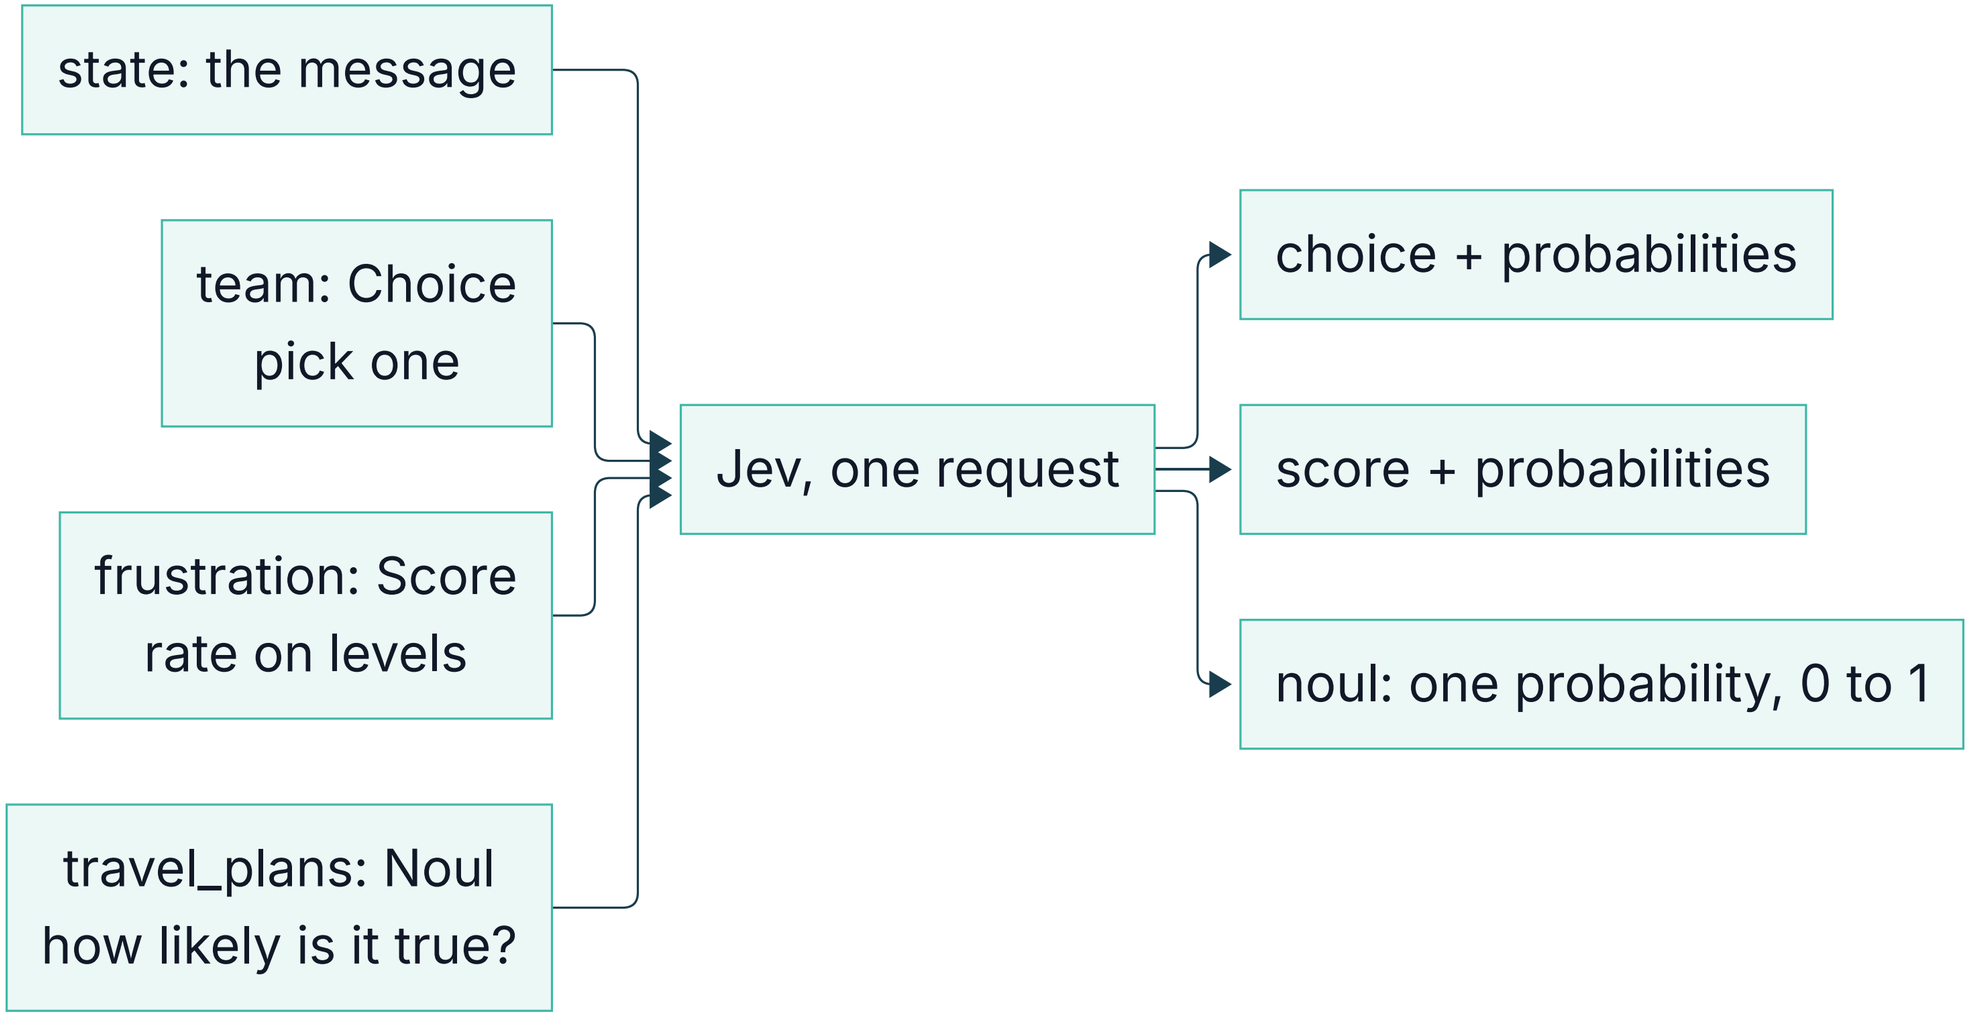

946 ms LLM + JSON schema	**252 ms** Jev	3.8x faster
$0.256 per 1,000, LLM + schema	**$0.022** per 1,000, Jev	11.6x cheaper

Both 72.5% to 77.5% accurate on 40 messages. Only Jev returns a probability per team.

One request, three kinds of question

Source: TypeSafe docs: Primitives · TypeSafe docs: State

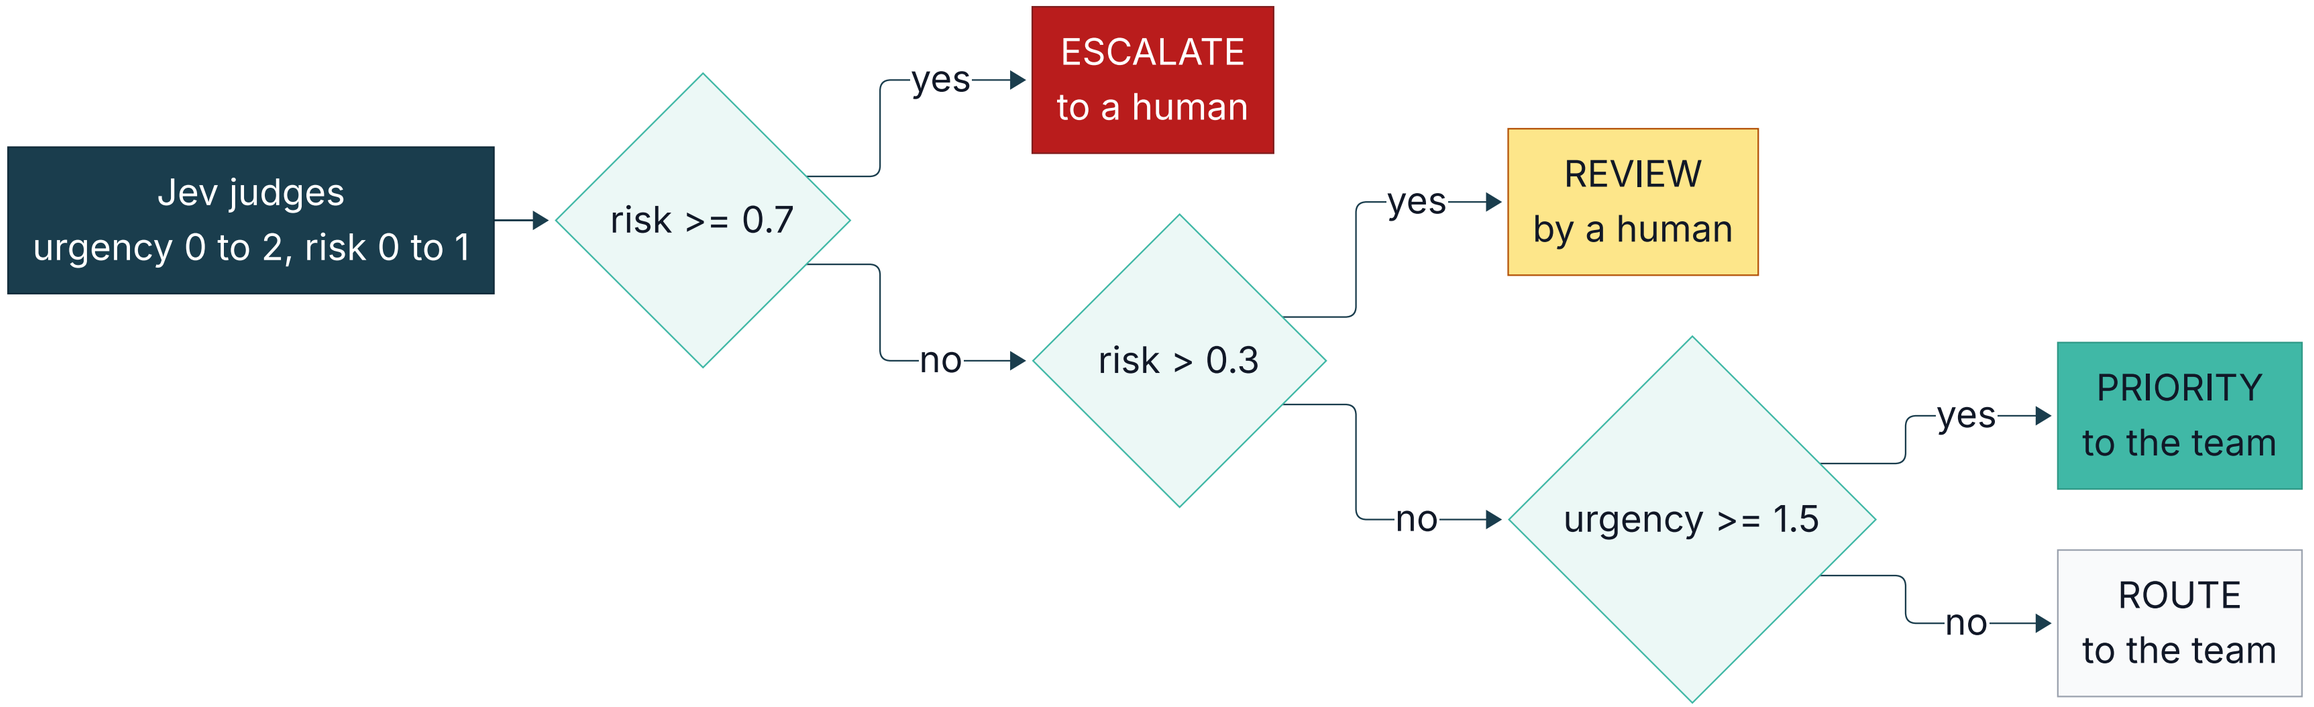

Read the distribution, not only the top answer

Score 0.70 is the weighted average level. Confidence 0.00: as spread out as an even split.

Rules in Python, not in the prompt

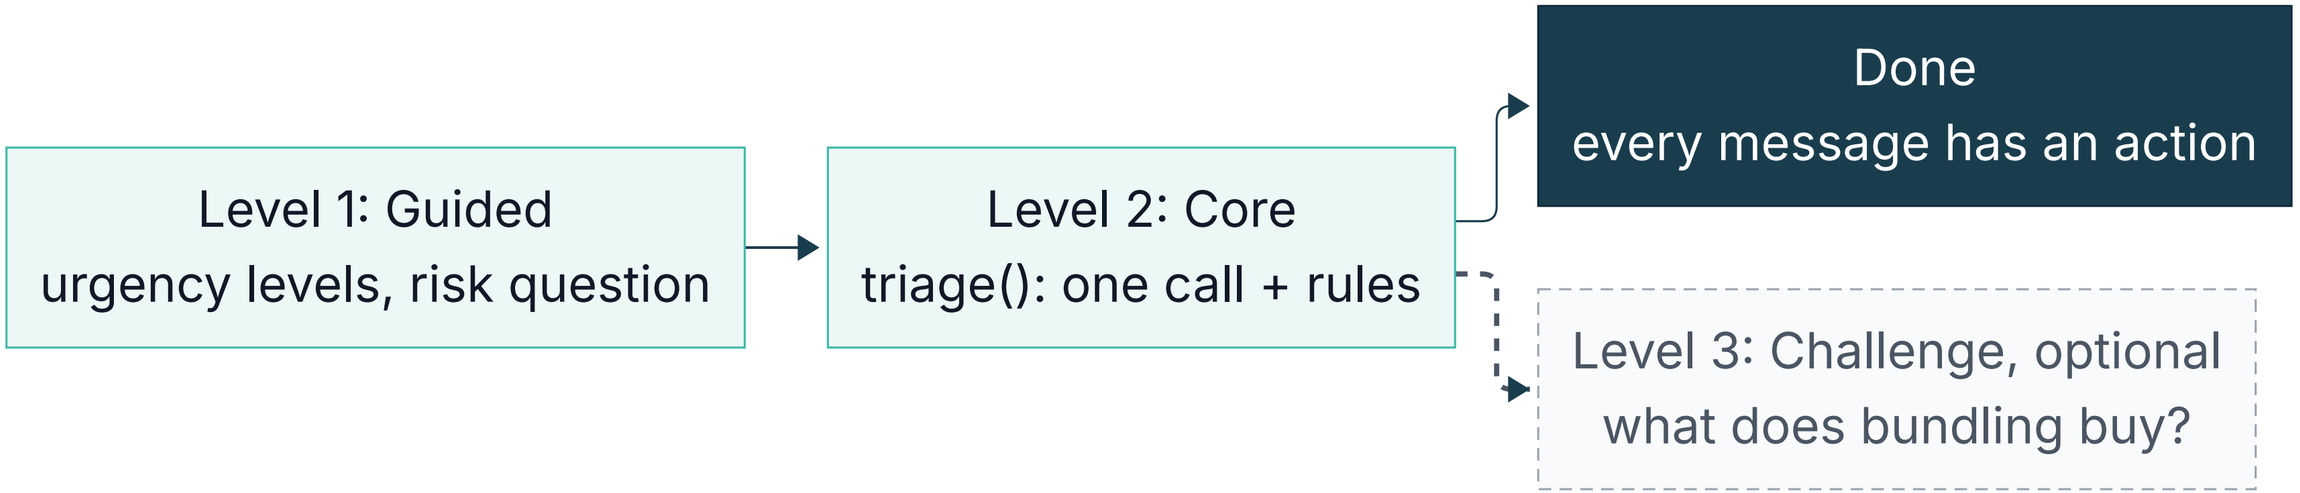

Change a threshold, not a prompt

Switch to the notebook: Lab 1

Lab 1: Build triage() in one call

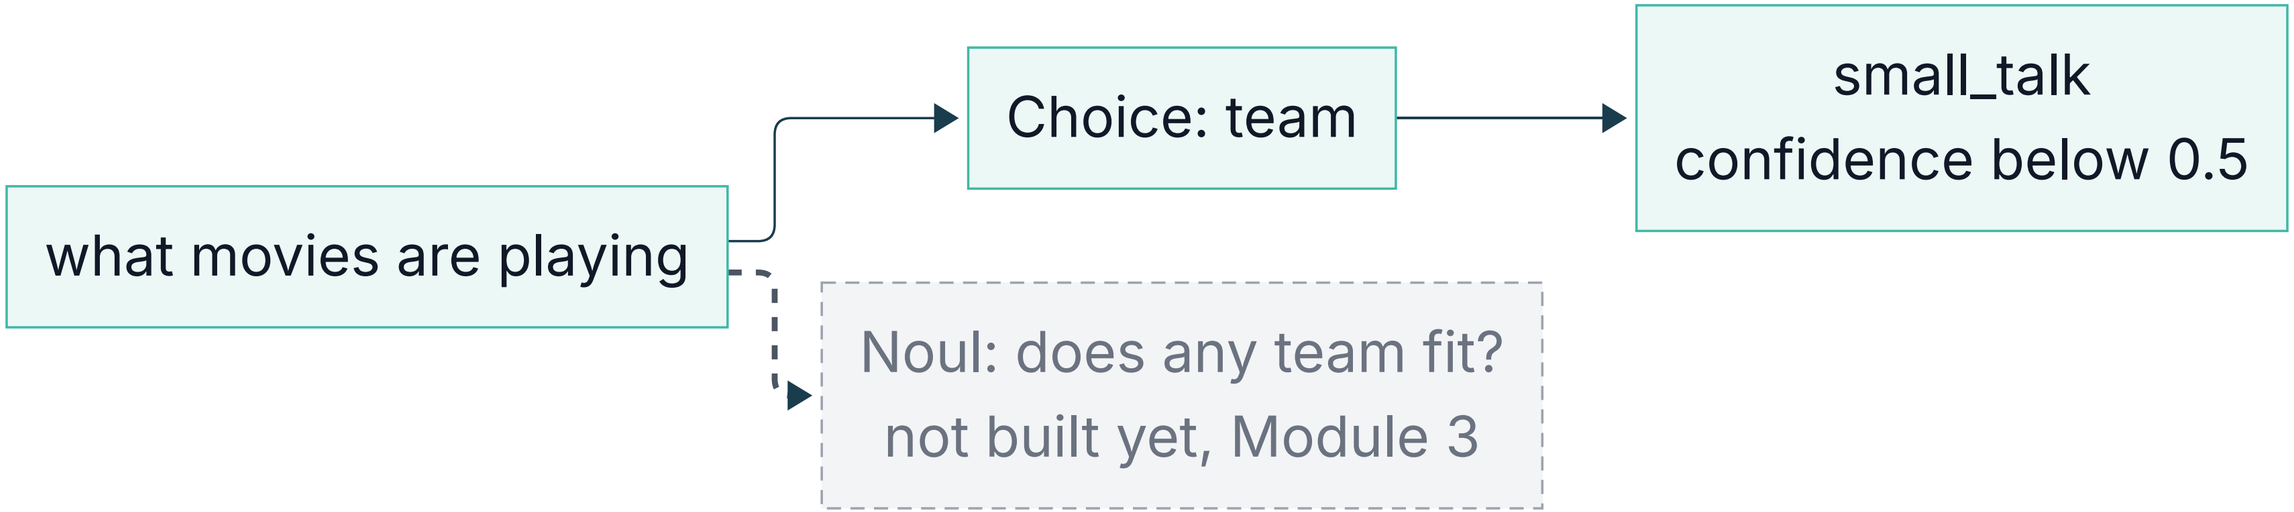

Urgent is not risky: the declined card

Separate questions for urgency and risk tell these two apart

Source: measured in this course on 2026-10-30 (12 lab messages)

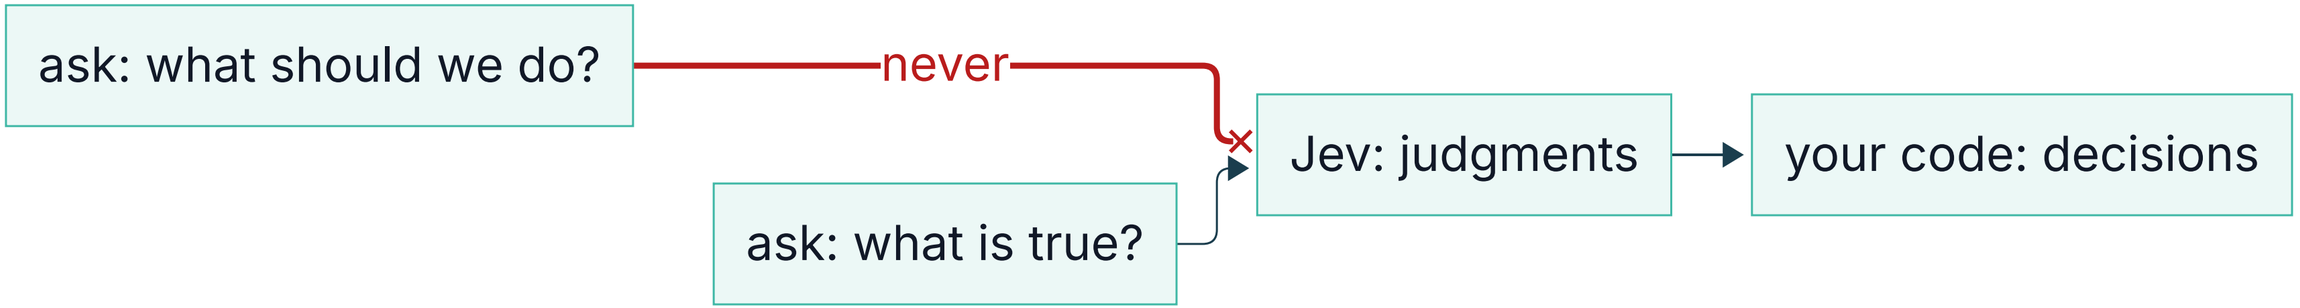

Jev always picks a team, even when none fits

Fix: a second question in the same request: does any team fit?

Source: measured in this course on 2026-10-30 · TypeSafe agent skill: ask about the null case separately

Jev judges, your code decides

Ask what is true. Let your code decide.
